

RedMed

Reducing Human Suffering

Product Requirements & Seed Investment Overview — A Passive-NFC Emergency Medical ID Bracelet. Local-First. No Accounts, No Backend.

STATUS	OWNER	PLATFORM	MISSION
MVP Scope · Seed Round Open	RedMed LLC	Web / iOS / Android	Reducing Human Suffering

1. THE PROBLEM

Medical alert bracelets today rely on QR codes. A QR code fails exactly when it matters most: in low light, under blood or grime, or when a good Samaritan — or a first responder — can't get a clean angle on the inside of a band without removing it from an incapacitated person's wrist.

- QR codes need clean light — never guaranteed in the dark, rain, or blood
- Most hide the code inside the band, under an unconscious wrist
- Apple Health needs the right phone, unlocked, and a responder who knows to look

How People Solve This Today: engraved dog tags, or the Apple Health app / Apple Watch Medical ID — neither as fast or simple as a single tap.

Where Current Solutions Fail: the market has over-engineered this problem and lost sight of the one job that matters — reducing human suffering in the first sixty seconds of an emergency.

2. THE SOLUTION

One Tap. First Aid, 911, And Your Info — Instantly.

A passive NFC bracelet for anyone with a lifelong medical condition, so a single tap — no app, no login, no signal required — surfaces first aid, an emergency call, and personal info instantly. Instead of a QR code, a passive NFC chip embedded in a rugged silicone band opens a locally-stored card the instant a phone taps it: first-aid basics, a one-tap 911 call, and the wearer's personal / emergency-contact info. No battery, no server, no breach — HIPAA-safe by design, because there is nothing centralized to breach.

3. COMPETITIVE LANDSCAPE

	REDMED	QR BRACELETS	APPLE HEALTH ID	ENGRAVED TAGS
Works In Low Light	Yes	No	Yes	Yes
No App Or Login	Yes	Yes	No	Yes
First-Aid Guidance	Yes	No	No	No

4. REGULATORY & PRIVACY

- Not a HIPAA covered entity or business associate — with no server, there's no centralized PHI store to breach
- Still in scope for the FTC Health Breach Notification Rule and state health-data laws (e.g. Washington's My Health My Data Act) — the local-only architecture is built to minimize exposure under both
- Tag data is intentionally unencrypted so any responder's phone can read it instantly — the same tradeoff every medical ID bracelet makes, disclosed up front

5. PRIORITISED FEATURES (MVP FOCUS)

FEATURE	DESCRIPTION	PRIORITY
Passive NFC Chip	NTAG216-class passive tag embedded in the band; powered by the reader's phone on tap, no battery	Must Have
Silicone Band	Sport/rugged silicone housing built for outdoor and firearms use	Must Have
Simple, Minimal Design	Clean band with no visible tech — reads as a normal wristband	Must Have
Durable / Rugged Build	Withstands sweat, impact, and daily outdoor wear	Must Have
Local Emergency Card	Tap opens a card with first aid, 911 call, personal + emergency contact info — stored on-device/tag only	Must Have
Vet / First-Responder Discount	Discounted pricing tier at checkout	Nice To Have
Bluetooth Chip	Adds a BLE radio for richer companion-app features	Nice To Have
IFAK / Med-Kit Referral Links	Affiliate links to first-aid kits from the emergency card, kickback revenue	Nice To Have
Wireless Charging + Action Button	Powered variant with charging and a physical button, Apple Watch-style	Nice To Have
Accounts, Database, APIs	Cloud sync, authentication, backend services	Not Prioritized

6. CORE USER JOURNEY

The whole flow is designed around one moment: someone else finds the wearer incapacitated.

- 1 Purchaser fills out their medical profile once (allergies, meds, conditions, emergency contacts) and saves it.

- 2 Purchaser taps their phone to the bracelet once to write the profile onto the passive NFC tag.

- 3 Wearer puts on the band and goes about life — no app needed day-to-day.

- 4 An emergency happens; a good Samaritan or first responder taps any smartphone to the band.

- 5 The phone browser instantly opens the local emergency card: first aid steps, a 911 call button, and the wearer's info — no app install required for the responder.

SCREEN	PURPOSE	FEATURES PRESENT
My ID / Edit Card	Purchaser fills in and saves their profile	Allergies, meds, contacts, notes form
Write Bracelet	Encode the saved profile onto the NFC tag	NFC write, tag capacity warning
Emergency Card	What a responder sees on tap	First aid, Call 911, personal / emergency contacts
Find 911 / Trauma Center	Locate nearby trauma care	Offline trauma-center lookup by state

7. BUSINESS MODEL

One product, one payment, no servers to run.

\$30–60, One Time

No subscriptions or backend — the profile lives on the band, so there's no recurring cost per customer.

Replacement, Not Repair

No battery to fail. A damaged unit means a new band from the store — the AirTag model.

Attached Revenue

IFAK affiliate links, plus a standing discount for veterans and first responders — a core, trusted audience.

Enterprise & Fleet Contracts

Bulk procurement by EMS agencies, fire departments and military units — a repeatable B2B2C channel.

8. MARKET

\$1.4B

Medical ID Bracelets — global market projected by 2033, up from ~\$0.85B in 2025. RedMed's direct category.

\$28.6B

Medical Alert Systems — broader wearable market by 2035, ~11% annual growth.

~2.3M

Beachhead Buyers — US EMS professionals and active-duty military, a concentrated trusted-channel wedge.

Sources: Precedence Research (medical alert systems, 2025), Verified Market Research (medical ID bracelets, 2024), NAEMT and DoD personnel figures.

9. GO-TO-MARKET

- Direct-to-consumer — full margin, no retail markup
- Veteran & first-responder communities — built-in trust and word of mouth
- Outdoor & hunting retailers — the shelf this design was built for

11. OUT OF SCOPE / LIMITATIONS

The MVP does not include user accounts, cloud sync, encryption of tag data, push notifications, or any backend service — all data lives in local storage and in the tag's URL. Tag contents are readable by anyone who taps, which is intentional so responders never need credentials. There is no way to remotely update or wipe a lost bracelet; a lost or stolen band must be manually rewritten with a fresh (or blank) profile.

12. SUCCESS METRICS & TRACTION

METRIC	WHAT IT TELLS US
Profiles Saved	How many purchasers actually complete their card
Bracelets Written / Activated	How many saved profiles make it onto a physical tag — clearest signal of real-world adoption
Emergency Card Opens (Tap-To-Info)	How often the tap-to-card flow is used in the field, and how fast it resolves — the whole product exists to drive this to zero

Pre-launch — figures to be filled in as pilots and early sales land.

13. THE ASK

TBD

Raise Amount

SAFE

Instrument

18 mo

Runway To Next Raise

Manufacturing & Tooling

Inventory

Stock to cover launch demand.

NTAG216 hardware, silicone molding, first production run.

Web & Setup Tooling

Setup form, tag-writing flow, training videos.

Go-To-Market

Launch marketing and channel partnerships.
